

Pig (*Sus sp.*)

There are some kinds of early pigs lived in Sangiran, among others are *Sus macrognathus*, *Sus brachynathus*, *Sus terhaari*, and *Sus stremmi*. The fossils were found in Kabuh Formation, with assumed dating of 780.000 years. The fossils findings are usually teeth fragments, mandibular and maxilla, and leg bones fragments.

Tiger (*Panthera tigris*)

Tiger (*Panthera tigris*) lived in Sangiran has the big and sharp canines, as the carnivorous animal. The fossils findings are skull, leg bones, and canines. The fossils were found in Notopuro Formation, assumed to be 700,000 years ago.

The tiger reached 2,3 – 3,3 meters in length, and the weight between 120 – 320 kilograms. The tiger has the stripes motif, as a camouflage so that their existences are hidden from their prey.
