

## Sangiran in Swamp Environment (1,6 - 0,9 mya)

The calm water environment and weak water current are the characteristic of swamp environment. The material was deposited by suspension way, to create clay sediment. Volcanic Mountain in Sangiran alternately were erupted resulted in volcanic dust and tucks between black clay sediment of Upper Pucangan Formation. Volcanic activism had continuously happen and resulted in sediment of volcanic materials, which then connecting the volcanic isle to be one mainland, and Sangiran area became brackish swamp environment and connected to the ocean far in eastern part. The land was broaden and finally reached the part of Northern Sangiran Area. Rivers and creek were created.
